I've spent 25 years solving exactly this problem—helping financial institutions redesign their operating models when regulation, technology, and business strategy collide.

What drew me to this role: Accenture's mandate to reshape how financial services think about transformation. Your description of moving beyond traditional methods to data-driven, sustainable models is where I've built my reputation. At Expert Zone Advisory, I've led similar missions for insurers and banks navigating regulatory complexity while implementing modern finance architectures. My last three engagements centered on Regulatory Reporting redesign, CFO office optimization, and closing process transformation—the core DNA of what you're building in Vienna.

The concrete proof: I spent two years as interim Finance Manager for a top-five European insurer, where I redesigned their entire closing process (8 weeks to 5), embedded new accounting controls post-IFRS 17, and built out a reporting architecture that reduced month-end variance reporting from 15 days to 3. Before that, I led the PMO for a major bank's finance transformation program—€18M budget, 30+ workstreams, stakeholder alignment across finance, compliance, and technology. Both taught me that the real constraint is rarely the software; it's clarity on what you're actually trying to measure and how you'll sustain change when the project ends.

I'm currently freelance through Expert Zone Advisory. You're offering a structured environment where I can apply that depth without carrying solo delivery risk. That's a good trade for both of us.

I'd like to talk about how you approach sustaining transformation once implementation wraps. That's where most programs stall.
