I bring 25 years of finance and insurance expertise directly aligned with what SimCorp needs. My background spans regulatory reporting, data integration architecture, and leading cross-functional transformation—precisely the blend required to guide clients through complex Data Management implementations across integration, warehousing, and system operations.

Most recently, I led a €2M regulatory reporting overhaul for a major insurer, redesigning how data flows from front office through to reporting—working daily with the exact systems complexity your clients face. Before that, I managed a multi-year data warehouse migration for a global financial services firm, owning the bridge between technical teams and C-suite stakeholders. I know what it takes to translate business requirements into clean implementations and keep delivery on track when things get messy.

I'm not new to software advisory. I've spent enough time in Dimension-type platforms to understand the detail work: configuration decisions that ripple downstream, standardization that actually sticks, and the difference between a working solution and one clients can maintain. I've also sat on both sides—as the consultant and as the client facing implementation—so I read organizational dynamics quickly.

The honest part: I've worked primarily as an independent consultant and interim manager, not in a traditional consulting firm. This is an asset for client-facing work (I've owned outcomes directly), but I understand you may want someone embedded in your methodologies and team from day one. The three-week Dimension Academy will close any gaps there fast.

I'm genuinely interested in this role because it sits at the intersection where I do my best work: technical depth, client impact, and real problem-solving. I'd welcome a conversation about how my delivery track record translates to SimCorp's approach.
