Re : Strategic Project Lead (Remote)

Cross-functional technology programs live or die on how well stakeholders coordinate across time zones and on a risk plan that catches problems before they hit production data. Translating business requirements into an actionable plan, then holding it to budget and a timeline while Finance, IT, Risk, and Actuarial teams pull in different directions, is the discipline this role calls for.

At CNP, I rebuilt the investment accounting production line under Solvency II constraints: 350 billion euros in assets under management, an 18-month deadline, delivered on time, with governance that kept those four functions moving on the same timeline. On a separate mission, I led a SimCorp Dimension implementation from design through go-live, coordinating vendor teams, internal IT, and business users across several sites, with UAT cycles designed to catch data migration risks before they reached production. I've also run accounting migrations where the failure mode is silent, wrong balances surfacing months after cutover, and built the reconciliation controls and contingency plans that keep that from happening. Progress on all three was tracked against measurable KPIs: closing timelines, reconciliation break counts, UAT defect rates.

What I haven't done is run project delivery inside a technology company shipping AI products. My AI exposure is recent, Vanderbilt and Yale certificates from 2026, not years of delivery experience there.

Worth 30 minutes to see if this maps to what you need?
