Re : Director Analyst - Accounting Process and AI Technology

Advising finance leaders on record-to-report transformation while AI adoption reshapes what "close" even means is a different exercise than running the transformation yourself. That gap between doing and advising is exactly where 25 years on the technical and delivery side of accounting transformation becomes useful to a research and advisory practice.

At a major French insurer, I rebuilt investment accounting production under Solvency II constraints across 350 billion euros in assets, delivered in 18 months, on time, with the sub-ledger and controls holding up under regulatory scrutiny. That work sits directly on top of record-to-report and controllership, the core of this role. On systems, I led SimCorp Dimension and Clearwater Analytics implementations end to end, from requirements to production cutover, including data migration and UAT for accounting interfaces, which is where automation promises usually meet the reality of legacy data. I've also built OD generation via VBA to clear aged suspense accounts, the kind of unglamorous automation work that tells you whether a technology recommendation will actually survive contact with a real close process.

Client-facing thought leadership content for external audiences is not something I've produced formally; my writing has been internal, for CFOs and audit committees, not published research.

Remote and hybrid work is standard practice for me. At Clearwater, most of the engagement ran distributed across time zones with no loss of rigor. Worth a call to see where this fits.
