I'm an experienced insurance finance consultant with 25 years in the sector—the last decade focused on transformation, reporting frameworks, and regulatory implementation. I'm drawn to this IFRS 17 role because it combines the technical depth and stakeholder complexity I work best in.

I've led similar transitions: redesigning financial processes during major accounting changes, building controls architectures from scratch, and moving projects from implementation into stable operations. Most recently, I've supported major insurers through regulatory reporting overhauls—mapping processes, designing controls, and embedding analytics that actually improve decision-making. I know the friction points in this journey: the gap between project teams and business-as-usual, the need for clean reconciliations under pressure, the constant dialogue between Finance and Actuarial to lock down variance stories.

My background is consultant-led, not employed, so I'm direct about tradeoffs. You get someone who's seen multiple implementations and knows what works. You also get someone in a 12-month window who moves at pace and doesn't need six months to add value. I'm based in France but London assignments are straightforward for me.

I'm qualified (equivalent to ACA), deeply familiar with UK GAAP, IFRS 17 processes, and Solvency II reporting. Excel and analytics tooling are core to how I work. I've built reporting models that survived audit and scaled as requirements shifted.

I'd welcome a conversation about how the transition is currently sequenced and where you see the biggest reporting or control gaps. Happy to discuss specifics on my calendar.
