Project accounting leadership at M&G aligns precisely with my background: 25 years in insurance and finance, most of it bridging Finance, Actuarial, and Systems—exactly the integration challenge your LC&FR programme is solving.

I've led similar technical accounting transformations. At a €2B+ insurance group, I redesigned the entire IFRS reporting model across three product lines while reducing manual processes by 60% and external contractor reliance by 75%. The work required the same cross-functional discipline your brief describes: holding IFRS standards firm, translating regulatory complexity for non-finance stakeholders, and designing scalable systems that actually stick. That project delivered nine months early because the SME function was clear about what had to hold and what could flex.

I work best where technical rigour meets delivery pressure. I'm comfortable being the primary interface between teams that don't naturally speak the same language—Finance and Actuarial especially. I've built and owned financial reporting controls frameworks, designed target-state processes, and managed the transition from design to live operation without losing the quality gains.

One honest point: I'm currently independent (Expert Zone Advisory). I've chosen consulting over permanent roles for flexibility, but the right mission—one with real strategic weight and 2–3 year horizon—can shift that calculus. Your programme sounds like that kind of work.

I'd welcome a conversation about how the transformation roadmap is shaping up and where the biggest technical and organisational risks sit.
