Re : Process Lead

Defining a Target Operating Model for budgeting, forecasting, and cost allocation inside a standard-first ERP environment is a different exercise from a typical finance transformation brief: it demands structuring processes before the system exists, not documenting them after the fact.

That's the work I've done repeatedly. At CNP Assurances, I rebuilt investment accounting production under Solvency II constraints, covering 350 billion euros in assets under management, delivered in 18 months and on schedule. That meant structuring business requirements, producing audit-ready accounting schemes, and facilitating workshops across Finance, Actuarial, IT, and Risk, exactly the multi-stakeholder setup this programme runs on. Separately, I've led data migration and system cutover projects, writing cahiers des charges, running UAT, and clearing suspense accounts, work that trains you to challenge legacy processes and produce documentation that holds up to audit scrutiny. Financial modelling and cost allocation logic have been constant threads across these mandates, whether the underlying system was SimCorp Dimension, Clearwater Analytics, or a general ledger being replaced.

My ERP platform depth sits with SimCorp Dimension and Clearwater Analytics rather than hands-on SAP or Oracle budgeting modules, so that part of the toolset would be new ground.

Hybrid delivery is standard practice for me, Clearwater was run largely remote-first, so the 3-days-onsite Luxembourg setup fits how I already work. Happy to walk through specifics on a call.
