Re : Financial Reporting Manager-Life Insurance

Building a financial reporting function for a life insurance platform still early in its Dublin setup means the reporting logic, controls, and IFRS 17 mechanics aren't inherited. They need to be built right the first time, under Solvency II and audit scrutiny from day one.

That's the kind of brief where prior IFRS 17 and investment accounting work under Solvency II constraints matters directly. At CNP, I rebuilt investment accounting production under Solvency II for a 350 billion euro book, delivered in 18 months, on time, with the auxiliary ledger and control framework holding up under regulatory review. Separately, I've led migrations between accounting interfaces and the apurement of suspense accounts during system cutovers, work that depends entirely on getting reconciliations and disclosures right the first time, not iterating after the auditors find the gaps. Both experiences map to what a new life platform needs: someone who can prepare regulatory returns and statutory reporting without an established process to lean on, and who treats month-end and quarter-end close as something to redesign under pressure rather than inherit.

Working across finance, actuarial, and external auditors on a distributed setup isn't new either. At Clearwater, I ran that coordination fully remote, so hybrid or distance work with Dublin stakeholders isn't a friction point.

Happy to walk through the CNP program in more detail if useful. Xavier Robitaille, +33 6 64 89 09 43.
