Re : Capital Optimization Director

Optimizing capital structure while managing regulatory pressure and multiple stakeholder groups at once is where the real difficulty in this role sits. Insurance capital allocation carries a specific complication most corporate finance mandates don't: solvency constraints sit on top of every funding and investment decision.

That's the exact intersection I've worked for 25 years. At CNP, I rebuilt investment accounting production under Solvency II constraints for a 350 billion euro asset base, delivering the redesign in 18 months against a hard regulatory deadline, coordinating finance, actuarial and IT teams whose reporting cycles didn't align at the start. On IFRS 9 implementations, I built the ECL and amortized cost logic that fed directly into capital and provisioning decisions, translating technical accounting rules into numbers senior leadership could act on. I've also run SimCorp Dimension and Clearwater Analytics implementations end to end, building the financial models and sensitivity analyses that support funding and investment calls, not just the accounting output behind them.

I haven't worked in a US regulatory environment. My prudential experience is Solvency II and ACPR, not US statutory or RBC frameworks, though the underlying capital modeling and stakeholder coordination work is the same discipline.

Happy to walk through how this maps to your current capital structure work on a short call.
