Re : Solvency II / Syndicate & Non-SII Reporting

Mapping Finance data and process flows across premiums, claims, reinsurance, cash, general ledger and Solvency II reporting to support a Special Purpose Arrangement operating model is exactly the kind of assignment where documentation discipline determines whether a transformation programme survives contact with regulators and auditors.

At CNP Assurances, I rebuilt investment accounting production under Solvency II constraints on 350bn€ of assets under management, delivered in 18 months and on time, including the sub-ledger design, accounting schemes and journal flows later needed for SII reporting. I've spent years mapping current and target-state Finance processes for regulatory reporting programmes, defining accounting treatments and system impacts across GL platforms, and identifying upstream and downstream dependencies before they become production incidents. My IFRS 9, IFRS 17 and Solvency II background (ACPR, ORSA, SFCR, QRT) covers the accounting logic underneath premiums, claims and reinsurance flows, which is the same logic driving QMA, QMB and RRQ returns.

I haven't worked directly in the Lloyd's or syndicate accounts market. My regulatory reporting experience sits in French and international insurance groups rather than syndicate structures.

Hybrid working is standard practice for me. At Clearwater, I ran the implementation remotely with the same rigour as on-site delivery. As a contractor who is a non-UK Tax resident, based overseas, IR35 does not apply to me.

Happy to walk through the CNP build in more detail on a call.
