I bring 25 years of insurance and finance experience—exactly what this role needs. My background combines IT spend governance, portfolio delivery oversight, and stakeholder alignment across complex organizations. I've spent my career at the intersection of Finance, Operations, and Technology, which is precisely where Senior IT Economics Manager lives.

Most recently, I've managed large-scale transformation programs where cost discipline and strategic alignment were non-negotiable. At a major insurer, I led financial planning and reporting for multi-million euro IT portfolios, tracking both change initiatives and run-state spend. I built reporting frameworks that gave Finance and Group Operations real visibility into where money was being spent and whether investments delivered promised benefits. I also managed vendor relationships and drove continuous process improvements—the kind of work that keeps IT spend predictable while preserving strategic flexibility.

What matters here: I understand both the language of IT delivery and the language of finance. I can challenge operating entities constructively because I speak their constraints. I've worked in fast-paced international environments (multiple group functions, distributed teams), and I know how to keep stakeholders aligned when priorities compete.

The main difference in my profile: I've worked as a senior consultant and interim manager rather than in permanent IT Economics roles. That's actually an advantage—I bring structured thinking and a focus on impact from day one. I don't need time to find my footing in complex matrix organizations.

I'd welcome a conversation about how to translate my delivery and governance experience into this specific role at Allianz. I'm based in France and entirely open to Munich-based work or flexible arrangements.
