I'm a consultant with 25 years in insurance—all of it. The last decade, I've spent navigating exactly the kind of complexity this role demands: multi-stakeholder environments where technical depth, regulatory constraints, and political alignment collide.

What makes me useful here: I don't just manage projects. I structure them. I've spent years building clarity across finance, IT, operations, and risk teams—the same cross-functional tension you're describing. I can guide a team of ten projects without losing sight of the assurers' real interests, which is the hardest part of this job.

Most recently, I led a regulatory reporting transformation for a major French insurer—same ecosystem (CNAM, institutional interfaces, data standardization). I mapped dependencies across six workstreams, ran the trade-offs between technical perfection and delivery timelines, and kept three competing stakeholder groups aligned for eighteen months. The result: on-time delivery, zero major rework, and a model that's still in use.

I should be direct: I've been independent for the last four years. I'm fluent in both worlds—the rigor of full-time delivery and the flexibility of interim work. If you're looking for someone to embed fully into the department, own the coordination, and build real accountability into how ten parallel projects move, I can do that. But I'd want to understand how this role sits with the broader organizational structure before committing.

I'm available to discuss how I'd approach your priority projects—the tiers payant layer, the normalization flows, the AMC coordination—and what kind of tempo you're aiming for.
