I bring 25 years of finance and insurance expertise directly aligned with what you're building at KPMG —particularly the technical depth in complex instruments, regulatory implementation, and credit risk frameworks.

My core strength sits where your role lives: the intersection of intricate accounting standards (IFRS 9, fair value hierarchy, hedge accounting mechanics) and the operational reality of getting teams to implement them. I've spent the last decade redesigning financial processes under regulatory pressure —closing frameworks, embedded derivatives, provision models, and the governance structures that keep them honest.

Two concrete examples. At a top-tier insurer, I led the implementation of IFRS 9 classification and measurement across a €40B portfolio—structured the data model, trained the actuarial and accounting teams, and bridged the gap between risk appetite and accounting treatment. The work required both technical rigor and the ability to translate complex derivative logic to non-technical stakeholders. More recently, I supported the redesign of credit risk reporting for a financial services client, including counterparty exposure analysis and collateral valuation methodologies—the kind of detailed, high-stakes work where one misunderstanding cascades.

What I bring operationally: I don't just advise on what **should** happen. I work through the implementation—process mapping, control design, testing, handover to operations. I'm comfortable holding complexity without losing clarity.

The honest thing: I've worked as an independent consultant and interim manager for the last decade. I'm built for this kind of specialized senior role, but I'm also genuinely open to the stability and scale of a structured firm environment where the work itself is the draw.

I'd welcome a conversation about how the current credit risk and hedging priorities map to where I can add most value.
