I bring 25 years of hands-on experience in insurance and financial transformation—exactly what Wavestone's Insurance Transformation team needs. My entire career sits at the intersection of finance/accounting process design, regulatory compliance, and system implementation. I've led process redesigns, managed multi-workstream transformations, and bridged the gap between business and IT delivery consistently.

Over the past decade, I've embedded myself in insurance operating models—from claims and underwriting workflows to Finance and Actuarial operations. I've overseen regulatory reporting implementations, managed CFO office transformation programs, and designed controls frameworks for digital-first environments. Most recently, I directed a multi-year Finance transformation for a €500M+ insurance client, where I translated complex accounting and Solvency II requirements into implementable SAP S/4HANA architectures. That project taught me how to move beyond theoretical models: I worked daily with Finance teams, Actuaries, and IT to ensure what we built actually worked operationally.

I'm genuinely interested in AI-driven optimization within insurance finance processes—not as a buzzword, but as a tool to automate routine reconciliations, strengthen forecast accuracy, and free senior staff for strategy. I've started exploring this with clients and see real opportunity there.

One honest note: I work as an independent consultant under my own structure (Expert Zone Advisory). I'm open to the right full-time or long-term contract role if the mission is strong and the fit is clear. This opportunity is genuinely interesting—the Insurance International Team expansion, the focus on digital transformation, and Germany as a base all align well.

I'd welcome a conversation to explore how my background meshes with your current client pipeline and team needs.
