Re : Senior Manager - Asset Management & Alternative Investment Transformation - Consulting (m/f/d)

Building an asset management transformation practice around Alternative Investments and tech-enabled delivery means the hard part isn't the strategy deck: it's making the system, the regulatory logic, and the operating model work together under client pressure. That's the specific problem I've spent 25 years solving from the investment accounting side.

I led the Clearwater Analytics implementation from design through production, including IFRS 9 categorization logic (ECL, amortized cost, ASD) and the reconciliation rules that made month-end close auditable. That project ran largely remote, which is how most of my recent work has been delivered, and it's the model I default to. On SimCorp Dimension, I handled data migration and the switch-over of accounting interfaces, building the securities sub-ledger and clearing legacy suspense accounts that had accumulated for years, with UAT scripts and VBA-built journal entries to close the gap cleanly. I've also redesigned closing processes end to end, cutting reconciliation friction between finance, actuarial, and operations, which is exactly the cross-functional coordination this role expects from senior advisors.

My depth is on the insurance and asset accounting side, not on alternative investment strategies like private equity or private debt structuring; my Solvency II and IFRS 9/17 background is adjacent but not identical to that world.

Happy to walk through how this maps to your current transformation pipeline, whenever suits you.

Xavier Robitaille
