Re : Senior Manager/Director, Finance Strategy, Technology & Transformation

Spearheading an ERP/EPM-enabled finance transformation while keeping Day 1 readiness on track after a merger means running strategic redesign and operational continuity in parallel.

I've led a SimCorp Dimension implementation from design through production, building the investment accounting sub-ledger under IFRS 9 categorization rules (amortized cost, ECL, ASD) and Solvency II reporting constraints. That work required getting actuarial, IT and finance teams to agree on a single chart of accounts and a shared data model across the platform.

On the integration side, I've run data migrations and accounting interface cutovers, writing functional specifications, leading UAT, and clearing suspense accounts before go-live. That's exactly the kind of Day 1 readiness work that determines whether a post-merger close happens on time or slips.

I've also taken over finance transformation programs mid-flight: redesigning closing processes and controls, and rebuilding governance so a stalled Target Operating Model design gets back on a delivery track. That combination, technical depth in investment accounting plus PMO discipline, is what ERP-enabled transformation projects need once the design phase ends and delivery starts.

I haven't worked inside a Big Four or a large consulting firm; my delivery experience comes from direct assignments inside insurance and finance organizations.

Would a call make sense to see where this fits your current pipeline of Finance Transformation engagements in Geneva?
