I've spent 25 years solving integration and delivery challenges in finance and insurance—exactly the complexity SimCorp clients face when deploying Dimension. Your Advanced Delivery Center role sits at the intersection of technical design, client alignment, and program execution. That's where I add the most value.

My last three years running Expert Zone Advisory involved designing and deploying data integration architectures for mid-cap insurers and asset managers navigating regulatory reporting and operational consolidation. One project: I led a multi-source data integration rebuild for a €2B insurance group—connecting legacy actuarial systems, accounting platforms, and risk reporting tools into a unified flow. Delivered on time, under budget, with zero data reconciliation issues in production. The pattern repeats: clients don't just need technical rigor; they need someone who translates their business constraints into executable architecture, then removes obstacles during delivery.

I work best embedded in cross-functional teams where clarity and discipline matter more than politics. Remote delivery across time zones is familiar—I've done it with teams in London, Paris, Dublin, and Luxembourg. I speak Polish at conversational level and spent time in Warsaw, so the location works well.

The honest gap: I've been freelance and advisory for five years. I'm genuinely open to returning to a structured consultant role if the mission, team, and client base align. This one does.

Let's talk about what a successful first 90 days looks like for your integration team.
