I'm a consultant with 25 years in insurance and finance, and I've spent the last decade managing complex portfolios where strategy meets execution—exactly what this role demands.

What makes me fit: I've rebuilt operating models and delivery frameworks in Life insurance environments where alignment between business and IT was broken. Most recently, I led portfolio rationalization for a major insurer's claims and underwriting systems, translating strategic objectives into 40+ prioritized initiatives across mixed business-IT teams. The result was a 35% reduction in run costs while maintaining SLA compliance and funding three major digital transformation workstreams. I've also managed the CFO Office's regulatory reporting stack, which meant owning applications across actuarial, finance, and compliance—the same stakeholder complexity you'll face here.

I understand the specifics of your context: Life insurance portfolios sit at the intersection of legacy system stability, regulatory constraint, and margin pressure. You need someone who speaks both worlds fluently—who can justify a system's operational cost to the business while explaining why IT can't simply "turn that off." I've done this repeatedly, and I can move quickly from strategy into the detailed delivery governance your Change & Run framework requires.

One thing to be direct about: I've been independent for five years, building advisory practices and interim leadership roles. This is a permanent structure, and I'm genuinely ready for it—the right role, the right organization. What I won't do is treat a CDI as a temporary engagement. I commit fully or I decline clearly.

I'd like to talk through how you're thinking about the portfolio's biggest friction points in the next 18 months—legacy modernization, the business case for consolidation, or something else. That conversation will tell us both whether this is real alignment.
