I bring 25 years of pure insurance and finance experience—exactly what this role demands. I've spent my career sitting at the intersection of technical accounting, regulatory compliance, and complex data migrations. Project Fusion and IFRS 17 implementations aren't theoretical for me; they're the exact terrain where I've added the most value.

Most recently, I led the financial close redesign for a specialty insurance group managing multiple syndicate structures and regulatory reporting frameworks. The core challenge mirrors yours: ensuring accuracy across UK GAAP and IFRS technical results while managing data integrity through system transitions. I built the controls architecture, drove analytics on financial drivers, and coordinated across Finance, Actuarial, and IT teams—the same stakeholder mix you're working with now.

On a previous mandate at Lloyd's, I owned the technical result analysis for syndicate reporting and supported the roll-out of new subledger implementations. I know how to interrogate financial data inputs for reliability, challenge process gaps, and translate actuarial and underwriting complexity into clean reporting that satisfies both Group and regulatory requirements. I'm comfortable holding the line on compliance while pushing for operational efficiency—these aren't in conflict when you design the architecture right.

The 12-month fixed-term structure is workable. I operate best as an interim financial manager or senior analyst—I'm wired for delivery, not politics. I'd engage fully as part of your London team, not as a remote consultant hovering at the edges.

I'd welcome a conversation about how you're structuring the Project Fusion workstreams and where the biggest data quality or control risks sit. Happy to discuss specifics around IFRS 17 inputs and the handoff between technical subledger and Group calculations.
