Re : Investment Banking Consultant | \$65/hr Remote

Training AI models to reason like an investment banking practitioner, on deal structuring, valuation, and pitch book quality, means the underlying financial logic has to hold up under expert review, not just read well.

That is the discipline I have applied for 25 years, on the investment and financial reporting side of banking and insurance.

At CNP, I rebuilt investment accounting for a 350 billion euro portfolio under Solvency II, covering amortized cost, ECL under IFRS 9, and asset classification, delivered in 18 months on schedule. That work required translating actuarial, accounting, and regulatory logic into models auditors and regulators could not challenge, the same precision valuation reports and financial models need to survive scrutiny. I have also led SimCorp Dimension and Clearwater Analytics implementations end to end, from design through production, where getting the accounting schema and cash flow logic wrong meant broken numbers downstream, not a minor bug. Across these projects I wrote and reviewed the technical documentation non-specialists had to act on: actuaries, IT teams, auditors, regulators, which is close to curating specialized knowledge for a non-expert audience.

My deal-structuring experience sits on the investment and insurance side rather than classic M&A pitch work; my valuation expertise is strongest in fixed income, structured credit, and regulatory capital.

I can walk through a few of these cases on a short call.
