Re : Lead Business Consultant - Alternative Investments

Alternative Investments is a specific skill set to source: SimCorp Dimension implementation projects live or die on whether the consultant actually understands the instruments, not just the screens. That's the gap this role is meant to close in Paris.

My background sits exactly there. At CNP, I rebuilt the investment sub-ledger production under Solvency II constraints, covering 350 billion euros of assets, and delivered the redesign in 18 months, on schedule, with the reconciliations holding up under audit. That work required the same combination this role asks for: knowing the accounting treatment (IFRS 9 categorization, amortized cost, ECL) well enough to translate it into system logic, and being the person a project manager can hand a workstream to without having to check it twice. I've also run data migration and cutover projects between accounting interfaces, including UAT campaigns and specification writing (CDC) for the target system, which maps directly to the requirement-gathering and enhancement-specification work described here. On the technical side, I've implemented SimCorp Dimension end to end, from design through production, so the platform itself isn't new ground.

I haven't worked on the Alternative Investments asset class specifically within a SimCorp Dimension project. My experience is on the traditional fixed income and listed equity side, though the accounting and regulatory logic (IFRS 9, Solvency II) transfers directly.

I work as an independent consultant today but I'm open to a permanent contract, either from the start or after an initial mission period. Happy to discuss how that could work on a call.
