I'm a senior finance & operations consultant with 25 years in insurance and asset management. I've spent the last decade delivering exactly these kinds of mission-critical accounting implementations—leading requirements definition, system configuration, regulatory reporting design, and UAT across complex portfolios.

What makes me useful for this role: I'm not new to the tension between vendor capabilities, regulatory constraints, and BAU transition timelines. I've sat in the SME seat across Solvency II reporting builds, fund accounting system migrations, and multi-portfolio ledger harmonization. I know how to map gaps between what the system does and what compliance actually needs. I've owned the testing scenarios, peer-reviewed UAT results, and managed the handoff to operations teams when they're under pressure.

Most recently, I led accounting design and reporting implementation for a €2.5bn portfolio transition into a new platform—similar scope to what you're describing. That meant owning requirements across three asset classes, coordinating with the vendor on customised reports, building overlay solutions for gaps, and managing stakeholder alignment across Finance, Risk, and Technical Accounting. The parallel run happened on time. Controls worked. The BAU team took over without drama.

I'm independent and working on a 12-month contract basis already, so the FTC structure is straightforward. The only honest gap: I'm based in Paris. That said, I've worked embedded in London teams before and I'm comfortable with regular travel or hybrid setup if that suits MS Amlin's needs.

I'd welcome a conversation about how the current transition timeline is shaping up and where the highest-risk dependencies are.
