I've spent 25 years building and running financial systems that actually work—from regulatory reporting infrastructure to investment accounting transformations. What SimCorp is doing with IAS Value Team aligns directly with what I know delivers results: horizontal delivery models work when someone owns both the outcome and the team's capability to achieve it.

At Euler Hermes, I led a parallel shift: moving from siloed accounting delivery to outcome-driven teams managing the full lifecycle of reporting solutions. We restructured four teams around client process outcomes, rebuilt the control framework, and reduced month-end close time by 35% while improving data quality. That's the same tension you're navigating—transforming from traditional software to services without breaking the engine.

I've done the harder part too. I've identified which roles actually need to exist (not reorganization theater), built the skill matrix when it doesn't exist, and made the calls about hiring and structure when the answer isn't obvious. I know what it takes to launch a value team that doesn't just exist on paper.

There's one real gap: I'm coming from advisory and interim leadership, not a permanent corporate role. I'm drawn to this because it's building something from scratch with real constraints—that's where I do my best work. But it's worth naming directly.

I'd like to talk about how you're thinking about the first 90 days—team composition, which outcome teams matter most, how you're measuring whether IAS Value Team is actually working. I have a framework for that.

Available for a call this week.
