I bring 25 years of insurance and finance expertise directly aligned with what Finalyse needs: the rare combination of deep technical risk knowledge, regulatory reporting mastery, and the ability to translate between Data and Risk teams without losing sight of implementation reality.

My last three years have been shaped by exactly this work. I've led Data Governance and regulatory reporting transformations for two large insurers, designing frameworks that connected BCBS239 principles to operational reality—working across actuarial, finance, and technology teams to make compliance stick without breaking the business. One engagement involved restructuring risk reporting governance for a €15B portfolio; the output was a scalable model that reduced reporting cycle time by 35% while hardening controls. I've also spent significant time on RDARR implementations and know the gap between regulatory intent and what actually works on the ground.

What I add: I'm not purely a data architect, nor purely a risk theorist. I sit in the middle—understanding how risk calculations actually flow through systems, where data quality fails in practice, and what governance frameworks actually hold when pressure hits. With Finalyse's clients, I'd bring that same pragmatism: designing Data Governance policies that satisfy the Board *and* don't create friction that kills adoption.

The honest gap: I've operated as an independent consultant for the past three years. The work has been full-time client-facing, but I'm energized by the prospect of being part of a team again—particularly one where risk expertise and delivery discipline matter as much as they do at Finalyse.

I'm based near Paris and can travel to Brussels flexibly. Let's talk about how I can contribute to your risk practice.
