I bring 25 years in insurance and finance transformation—the exact context you need for this role. I've spent the last decade translating operational complexity into digital design that actually works, which is precisely what your Digital Operations Business Partner does.

My strongest fit: I've spent significant time embedded in broking and operations finance, designing systems that bridge what teams need versus what technology delivers. At one major insurer, I led the redesign of their operational control framework across three business units—250+ people, multiple platforms, competing priorities. The work required understanding process friction in real time, building trust with operations leaders skeptical of "digital," and protecting agreed standards while delivering iteratively. That's your GBC Target Operating Model challenge.

More recently, I've advised on platform adoption and operating model transitions—exactly the BAU partnership you describe. I can translate pain points into clear requirements, challenge design forum decisions with options and tradeoffs, and hold the line on architectural integrity without blocking progress.

The gap is honest: I'm currently independent (Expert Zone Advisory), not in a permanent role. That's actually an asset here—I bring the focus and urgency of an outsider, no internal politics, and I'm built for senior advisory work where business acuity matters as much as execution discipline.

I know the London Market context well enough to be dangerous but junior enough to learn your specific platforms—ABCoP, GRIDS, DPX, Whitespace, PPL. That's your real win: someone who understands broking operations deeply but isn't locked into "how we've always done it."

Let's talk about what you're actually trying to solve operationally, and whether my lens on digital change translates to your context.
