I bring 25 years of insurance and finance expertise directly to the problems that matter most: regulatory complexity, operating model redesign, and delivery under pressure. I've spent my entire career at the intersection of finance, actuarial requirements, and IT delivery—the exact space where most transformations stall.

On my last two engagements, I led a complete finance operating model rebuild for a €500M+ mutual insurer (scope: process redesign, control framework, closing cycle compression from 12 to 8 days) and managed a parallel regulatory reporting programme across three legacy systems migration, delivering on schedule despite a mid-stream requirement change. Both landed because I translate between Finance, Actuariat, Operations, and IT without losing the constraint.

I work best on missions where clarity and execution discipline solve what strategy alone cannot. I'm structured, I document, and I make sure the hand-off sticks.

I operate as an independent consultant (Expert Zone Advisory SAS), so there's no hiring friction—just the work. The trade-off is I'm built for defined projects and strong governance, not open-ended titles.

Let's talk specifics: what's the core delivery problem you need solved, and what's the timeline?
