Dear Hiring Manager,

Your cybersecurity chief of project role sits at the intersection of what I've built my career around: technical rigor, delivery discipline, and navigating complex stakeholder environments under real pressure.

For 25 years I've worked in insurance and finance—domains where security, compliance, and operational excellence aren't optional. Most recently, I've led programs that blend similar tensions: aligning IT, Risk, and business teams while managing portfolios with tight budgets, regulatory constraints, and zero tolerance for failure. At CNP, that translates directly. I understand how SecOps projects live in a world of competing priorities. I know how to decompose them operationally, resource them honestly, and escalate risks before they become crises.

Two concrete examples. I redesigned a major finance function's operating model across three entities —scoping requirements, planning sequencing, coordinating 40+ internal and external stakeholders, tracking KPIs monthly. No timeline slippage. On another engagement, I built governance frameworks for transformation programs where security controls had to coexist with delivery speed. Both taught me that structure, clarity, and ruthless focus on what matters separates executed projects from stalled ones.

The honest gap: I've been independent consultant for the past three years. I'm looking to anchor back into a structured environment where I can build something. A role this high-stakes, with a group-wide cybersecurity mandate, is exactly where I want to plant myself.

I'd welcome a conversation about how to structure the first 90 days.

Best regards,

Xavier Robitaille
