Re : Senior Project Manager (Remote)

Running end-to-end project delivery across Finance, Actuarial, IT, Operations and Risk, while keeping outcomes tied to Arch's strategic goals rather than isolated deliverables, is exactly the kind of matrix-environment problem I've spent my career solving.

At CNP Assurances, I rebuilt investment accounting production under Solvency II constraints, covering 350 billion euros in assets under management, and delivered the migration on the 18-month timeline with no slippage. That required the same discipline this role asks for: risk identification well before it threatened the schedule, structured change control, and weekly status communication to senior stakeholders who didn't share a technical vocabulary. On a separate mandate, I led the cahier des charges and UAT recette for an accounting interface migration, coordinating business SMEs and IT so that suspense accounts were cleared before go-live rather than inherited afterward. Both mandates depended on business stakeholder management as much as on the technical build, which is the part of PMO work I find gets underweighted in job descriptions and overweighted in execution.

My PM experience is almost entirely European insurance and asset management; I haven't run projects specifically inside a US regulatory or matrix structure.

I'd welcome a call to walk through how this maps to Arch's PMO framework.
