With 25 years in insurance and finance transformation, I've built my career precisely where technical complexity, regulatory constraints, and delivery pressure intersect—the exact space where a Program Director creates the most value.

What draws me to this role at Sapiens: you need someone who understands insurance operations deeply enough to translate business requirements into software implementation scope, manage multi-site delivery without losing grip on quality, and keep international clients satisfied when scope shifts or risks emerge. I've done exactly this.

Over the past decade, I've led large-scale program delivery across Europe—most recently steering a complete finance operating model redesign for a major insurance player, coordinating 15+ workstreams across three countries, implementing new systems, and delivering €2M+ in process efficiency gains. Before that, I ran a €4M regulatory reporting transformation spanning actuarial, finance, and IT teams across three legal entities. Both required matrix management, client relationship discipline, and the kind of stakeholder clarity that prevents projects from drifting.

I speak English fluently, am comfortable with 50% travel, and have worked extensively in hybrid models. I also know the insurance domain—claims, underwriting, reserving, regulatory reporting—not just the project mechanics.

One honest note: I've spent the last 15 years as an independent consultant. I deliver results, meet timelines, and manage complex stakeholders. If you need someone who'll own a program end-to-end with senior accountability, that's me. If the role requires someone embedded full-time in corporate structure, that's a fair conversation to have upfront.

I'd welcome a discussion about how my track record matches what you're building.
