I bring 25 years of finance and insurance transformation experience directly into asset management and capital markets work. My background translates cleanly: I've spent a decade redesigning front-to-back processes, building operating models that actually work, and stewarding complex programs from concept through live migration. That experience maps directly to what Capco needs—I understand both the trade and fund lifecycle machinery and how to rebuild it.

Most recently, I've led multi-workstream transformation programs where the real value came from sitting at the intersection between business teams, technology, and operations—exactly the connector role you've described. One program involved redesigning regulatory reporting flows across a €2B+ asset management operation; another centered on closing process automation and control redesign for a major insurer. Both required the analytical discipline to map requirements, develop target operating models, and stay oriented through implementation chaos.

I speak German professionally and English fluently, so the Munich/Frankfurt hybrid setup works. I know these platforms matter—Aladdin and Bloomberg are part of the landscape I work in. Agile delivery isn't theoretical; I've run programs with distributed teams across multiple time zones and learned when to push structure and when to give teams room.

One honest note: I've been independent for the last five years. I thrive in that mode. But I'm open to a senior consultant permanent role if the work is substantive and the team is serious about delivery—not as a lifestyle change, but because this particular problem set and organization align with where I want to focus next.

Let's talk about how you're approaching the Fund Lifecycle work specifically.
