Your data transformation project needs someone who's piloted similar complexity in regulated environments. I bring 25 years in finance and insurance—the last decade leading PMO and program delivery where multiple stakeholders, tight governance, and regulatory constraints were the baseline, not the exception.

I've managed multi-actor transformation programs with the same DNA as your mandate: modernizing data processes, aligning business, IT, and institutional actors, navigating compliance requirements that shape every decision. On a recent mandate, I redesigned a regulatory reporting operating model across finance, actuariat, and operations—coordinated 15+ stakeholder groups, maintained governance rigor through PRINCE2 discipline, and delivered on a compressed timeline with zero scope creep.

That blend matters here. You're not hiring a pure methodologist; you need someone who reads the institutional politics, anticipates where risk actually hides (not just on the risk register), and can arbitrate between "what's technically right" and "what the public sector will fund and sustain." I've done that in insurance closing redesigns, process transformation, and PMO setup where the real constraint was always organizational alignment, not methodology.

One honest angle: I've been independent consultant the last few years, not employed. That's a fit question worth addressing directly—if you need someone embedded long-term in a single institutional culture, we should discuss it. If you need someone who lands fast, stabilizes a complex program, and builds lasting governance, that's where I add the most.

I'm ready to talk specifics on scope, stakeholder mapping, and how you're currently thinking about risk and timeline. Let's grab 30 minutes if the fit looks real from your side.
