Re : Senior Implementation Consultant - Client Reporting

Delivering SimCorp Client Reporting means turning data models and layouts into outputs clients trust for regulatory and operational reporting. That's the exact intersection where I've spent the last stretch of my career: SimCorp Dimension implementation, SQL-heavy data work, and the discipline of getting reporting right under scrutiny.

At a French insurer, I rebuilt the investment accounting production chain under Solvency II constraints, covering €350bn in assets, delivered in 18 months and on schedule. That work required deep data modelling: mapping source systems into SimCorp Dimension, writing and validating SQL against the data warehouse, and reconciling outputs against regulatory reporting requirements (SCR, QRT). I've also led migration and data cutover projects where the job was to get comptes and interfaces clean before go-live, then prove it through structured UAT. That's the same rhythm as scoping, configuring, testing, and deploying a client reporting solution: workshops to translate business needs into functional design, then holding the detail until it's right.

Power BI and Crystal Reports are tools I've worked around rather than built reports in myself; my depth is on the data and SQL side, less on the visualization layer.

Hybrid work is standard practice for me, most recently at Clearwater, and remote collaboration tools aren't a friction point. As a contractor who is a non-UK Tax resident, based overseas, IR35 does not apply to me. Happy to walk through the SimCorp Dimension work in a call.
