Re : Principal Back Office Business Consultant, Sophis / Fusion Invest

Leading a Fusion Invest / Sophis back office implementation means sitting at the intersection of accounting standards, market practice, and a client's own operating model. That's the specific mix this Principal Business Consultant role asks for, and it maps closely onto how I've spent most of my career.

At CNP Assurances, I rebuilt investment accounting production under Solvency II constraints across 350 billion euros in assets under management, delivering the new setup in 18 months, on schedule, with the back office running clean through the switch. That project required the same combination this role calls for: deep technical knowledge of accounting mechanics (IFRS 9 categorization, amortized cost, ECL), direct client-facing work to translate business requirements into system configuration, and the discipline to keep a complex delivery on track under regulatory pressure. I've also led data migrations and interface cutovers for securities sub-ledgers, including UAT campaigns and clearing of suspense accounts, work that sits right next to what a Fusion Invest / Sophis implementation demands on the back office side.

I haven't implemented Fusion Invest or Sophis directly. My systems depth is in SimCorp Dimension and Clearwater Analytics, which cover the same functional ground: position keeping, accounting schemas, back office controls for capital markets and buy side instruments.

I currently work as an independent consultant, and I'm open to this being a permanent position, either directly or after an initial assignment period. Happy to walk through the CNP project in more detail if useful.
