I bring 25 years in finance and insurance transformation—exactly what Deutsche Börse needs for this role. My strength is translating regulatory and accounting complexity into executable solutions while keeping Finance, IT, Risk, and business teams aligned.

Over the past decade, I've led similar initiatives: redesigning regulatory reporting frameworks for insurers, coordinating multi-workstream projects across IFRS/local GAAP transitions, and embedding automation into control-heavy environments. Most recently, I managed a full finance operating model transformation for a mid-cap insurer, bridging accounting requirements with IT implementation across three reporting standards. The result: 40% process improvement, tighter controls, and a documented framework that survived regulatory audit without friction.

What fits here specifically: I understand the tension between Regulatory Reporting, Financial Accounting, and system reality. I've written requirements that developers can actually build. I've sat in rooms with external auditors and competent authorities—I speak their language but don't let perfectionism kill momentum. And I know how M&A and restructuring create chaos in accounting infrastructure; I've stabilized that more than once.

I work best in roles where clarity, governance, and delivery matter equally. Deutsche Börse's CFO-led mandate appeals to me. I'm comfortable in matrix environments and can move fluidly between stakeholder management and technical detail.

One honest note: I'm currently independent (Expert Zone Advisory). I'm open to a fixed-term contract or a project-based arrangement. If your timeline requires someone to ramp fast and own outcomes end-to-end, that's where I add immediate value.

I'm in Luxembourg regularly and available to discuss how I'd structure the first 90 days. Happy to walk through a recent project in detail.
