I bring 25 years of finance and insurance expertise directly into SimCorp's ABOR implementation space. My strength isn't theory—it's bridging the gap between complex regulatory accounting requirements and operational reality. That's what ABOR implementations need: someone who understands both what controllers demand and how end-users actually work.

Over the past decade, I've led similar transformation projects where the real work happens at the intersection of financial systems, compliance, and user adoption. I redesigned month-end closing processes for a major insurer, cutting manual reconciliation by 60% while strengthening audit trails—exactly the type of operational value SimCorp's clients expect. I've also spent years in PMO and AMOA roles, managing cross-functional stakeholders (Finance, IT, Operations, Risk) under regulatory pressure. That experience taught me how to coordinate escalations, anticipate friction points, and keep projects moving without cutting corners on control.

What matters here is execution. ABOR goes live when consultants can translate client pain points into system configuration, coach teams through the transition, and stay sharp enough to catch requirements gaps before they become implementation delays. I work best in that role—as the sparring partner who understands the client's business, speaks the language of accounting rigor, and can debug both technical and organizational obstacles.

One honest note: I've spent the last years as an independent consultant. I'm genuinely interested in joining a team again—especially one where depth in finance and systematic thinking on delivery actually count. The collaborative environment you describe at SimCorp resonates with how I work best.

I'm available to discuss how this background maps to your ABOR projects and client needs.
