I bring 25 years of insurance transformation experience—the exact depth Vantage Point needs to deliver this programme successfully. I've spent my entire career at the intersection of business requirements, technology delivery, and regulatory complexity that defines modern insurance replatforming.

My last three years have centred on exactly this work. I led the PMO and business analysis for a €40M operating model redesign across a mid-market insurer, managing stakeholder alignment across Finance, Actuarial, Operations, and IT during a parallel run with legacy and new systems. I've documented requirements for system migrations, designed process improvements that cut processing cycles by 35%, and sat in the room when business assumptions met technical reality—then found the path forward.

Before that, I spent a decade in similar transformation roles: designing CFO office workflows, supporting regulatory reporting implementations, and managing the delivery side of major platform upgrades. I'm fluent in the language of both business and technology teams. I know what questions to ask. I know when a stakeholder concern is a blocker versus a preference. I deliver.

What's relevant here: I understand Guidewire and EIS ecosystems from implementation perspective, not just theory. I've done the gathering, analysis, and documentation work at scale. I can move between high-level strategy conversations and detailed technical workshops without losing coherence.

One honest note: I've been freelance for the last 18 months running my own advisory practice. I'm open to a 12–18 month consultant role if the programme has real substance and the team is serious about delivery. This programme looks like both.

I'm based in the EU but comfortable with London hybrid and UK travel. Let's talk about what you need to move this forward.
