I'm a senior consultant with 25 years in finance and insurance operations—the exact ground where SimCorp One needs to root itself. My last three years have been deep in operational transformation: redesigning trade processing workflows, building reconciliation frameworks that scale, and translating regulatory accounting demands into implementable system configurations. I speak both the language of operations teams managing STP rates and settlement timelines, and the language of architects designing repeatable solutions.

What makes me relevant here: I've done the work on both sides. At a major insurance group, I led a front-to-back process redesign that cut settlement cycle time by 40% and established the reference architectures that became standard for 15+ implementations. More recently, I've been the trusted voice in rooms where operations, accounting, risk, and product had to align on what "scalable" actually meant. I know the T+1 pressures. I know where reconciliation breaks. I know what clients mean when they say they need operational excellence but don't yet know how to build it.

The honest part: I'm coming from independent consulting and deep expertise work, not a Product role embedded in a vendor organization. What I bring—domain authority, operational credibility, ability to distill complexity—is strong. What I'll need to learn is SimCorp's product architecture and your specific client archetypes. I learn fast and I'm not territorial about being the learner in the room.

If operational credibility and the ability to define "what good looks like" across middle and back-office domains matter, I'd be worth a conversation. I'm based in continental Europe but open to London.
